Origins and Growth

Humble Beginnings

From startup to industry leader

Initial Launch

Swiggy began its journey in 2014, focusing on providing **quick and efficient** food delivery services that transformed the way people ordered meals in India's bustling cities.

Expanding Reach

Within a few years, Swiggy rapidly expanded its services, reaching millions of customers across multiple cities, significantly enhancing its delivery network and introducing innovative solutions to meet demand.

Questions & Insights

1. DISPLAY ALL CUSTOMERS WHO LIVE IN 'DELHI'.

```
select customer_id, name, city from customers  
where city = "Delhi";
```

#INSIGHT.

Display all customers who live in 'Delhi' means displaying only customer records from the database who live in the city of Delhi.

2. Find the average rating of all restaurants in 'Mumbai'.

```
select restaurant_id, name, avg(rating) from restaurants  
where city = "Mumbai"  
group by restaurant_id, name;
```

#INSIGHT

The average rating of Mumbai restaurants gives an idea of the overall quality of restaurants in Mumbai. This identifies high-rated and low-rated restaurants, providing an idea of customer satisfaction and market competition.

3. List all customers who have placed at least one order.

```
select customer_id, order_date, status from orders  
where order_date > 1 and status = "completed";
```

#INSIGHT

This query identifies customers who have placed at least one successful (completed) order. This reveals active customers who are actually generating revenue for the business.

4. Display the total number of orders placed by each customer.

```
select customer_id, count(order_date) from orders  
group by customer_id;
```

#INSIGHT

This query counts the total orders for each customer, which helps determine who is a repeat customer and who is a one-time buyer.

5. Find the total revenue generated by each restaurant.

```
select restaurants.restaurant_id, restaurants.name, sum(orders.total_amount)total_amount
from restaurants join orders
using(restaurant_id)
group by restaurants.restaurant_id, restaurants.name;
```

#INSIGHT

This query calculates the total revenue for each restaurant, making it clear which restaurants are driving the most revenue. This insight allows businesses to identify top-performing versus low-performing restaurants and plan promotions, partnerships, or improvement strategies.

6. Find the top 5 restaurants with the highest average rating.

```
select restaurant_id, name, avg(rating)avg_rat from restaurants  
group by restaurant_id, name  
order by avg_rat desc  
limit 5;
```

#INSIGHT

This query identifies the top 5 restaurants with the highest average rating, meaning these restaurants are performing best in customer satisfaction.

With this insight, businesses can highlight and promote these restaurants, and use their best practices as a benchmark for other restaurants.

7. Display all customers who have never placed an order.

```
select customers.customer_id, orders.order_date  
from customers left join orders  
using(customer_id)  
where order_date is null;
```

#INSIGHT

This query identifies customers who haven't yet placed an order. With this insight, businesses can target inactive users and encourage them to place their first order through offers, reminders, or onboarding improvements.

8. Find the number of orders placed by each customer in 'Mumbai'.

```
select customers.customer_id, count(orders.order_date) from  
customers join orders  
where city = "Mumbai"  
group by customers.customer_id;
```

#INSIGHT

This query identifies customers who haven't yet placed an order.

With this insight, businesses can target inactive users and encourage them to place their first order through offers, reminders, or onboarding improvements.

9. Display all orders placed in the last 30 days.;

```
select orders.order_date from orders  
where order_date >= date_add(order_date, interval - 30 day);
```

#INSIGHT

This query identifies orders placed in the recent 30 days, providing a clearer picture of current customer activity and demand trends. This insight allows businesses to track recent performance, analyze short-term sales trends, and make faster marketing/operations decisions.

10. List all delivery partners who have completed more than 1 delivery

```
with a as(select deliverypartners.partner_id, deliverypartners.name, orders.status, count(orders.order_date)total_delivery
from orderdelivery join deliverypartners
using(partner_id)
join orders
using(order_id)
group by deliverypartners.partner_id, deliverypartners.name,orders.status
having total_delivery >=1)

select * from a
where status = "completed";
```

#INSIGHT

This query identifies delivery partners who have completed multiple successful deliveries, meaning they are actively delivering orders.

This insight allows businesses to identify reliable versus low-activity delivery partners and make decisions about workload distribution, incentives, and performance improvement.

11. Find the customers who have placed orders on exactly three different days.

```
select customer_id, count(distinct order_date)total_order from orders  
group by customer_id  
having total_order = 3;
```

#INSIGHT

This query identifies customers who placed orders on exactly three different days, meaning they are moderately engaged repeat customers. This insight allows businesses to target these customers for loyalty programs, personalized offers, or retention campaigns to help them become heavy repeat buyers.

12. Find the delivery partner who has worked with the most different customers.

```
select deliverypartners.name, deliverypartners.partner_id, count(distinct orders.customer_id)
from orders join orderdelivery
using(order_id)
join deliverypartners
using(partner_id)
group by deliverypartners.name, deliverypartners.partner_id;
```

#INSIGHT

This query identifies the delivery partner who has delivered the most orders to different customers,

meaning the one with the maximum customer exposure and experience.

With this insight, businesses can identify the most trusted/highly utilized delivery partner and provide them with priority assignments or incentives.

13. Identify customers who have the same city and have placed orders at the same restaurants, but on different dates.

```
select c1.customer_id, c1.name, c1.city, o1.order_date,  
c2.customer_id, c2.name, c2.city, o2.order_date, restaurants.restaurant_id  
from customers as c1 join orders as o1  
on c1.customer_id = o1.customer_id  
join restaurants on restaurants.restaurant_id = o1.restaurant_id  
join orders as o2 on restaurants.restaurant_id = o2.restaurant_id  
join customers as c2 on o2.customer_id = c2.customer_id  
where c1.customer_id <> c2.customer_id and  
c1.city = c2.city and  
o1.order_date <> o2.order_date;
```

#INSIGHT

This query identifies pairs of customers who live in the same city and order from the same restaurant, but on different dates. This insight gives businesses an idea of shared customer preferences, locality-wise popular restaurants, and repeat demand patterns, which can help improve hyper-local marketing and recommendations.
